

Anti-fungal Pharmaceutical Compositions Comprising an Active Ingredient  
Prepared from *Zingiber officinal*

Cross-reference to Related Application

5 The present application is a continuation-in-part application of U.S. Patent Application Serial No. 09/648,662, filed August 26, 2000. The above-listed application of Serial No. 09/648,662 is commonly assigned with the present invention and the entire content of which application is incorporated herein by reference.

10

Field of the Invention

The present invention is related to a method of preparing an extract potent in anti-fungal activity from *Zingiber officinale*.

15 Background of the Invention

Chinese crude drugs or spices eg. *Zingiber officinale*, *Eugenia caryophyllata*, *Allium sativum*, have been used in medicine and in flavoring foods. Crude ginger is used as an anti-emetic and expectorant, an anti-tussive and accelerator of the digestive organs. Semi-dried old crude ginger is also used for stomachache, chest pain, low back pain, cough, common cold and as a cure for a form of edema being called "stagnate of water". Zingerone is the major component which accounts for the spicy character of ginger; gingerol and shogaol are other pungent components in ginger. Gingerol has cardio-tonic action, suppresses the contraction of

isolated portal veins in mice, and modulates the eicosanoid-induced contraction of mouse and rat blood vessels. Shogaol exhibits pressor response. Both gingerol and shogaol are mutagenic, whereas zinger and zingerone have been found to exhibit anti-mutagenic activity. Shogaol 5 has inhibitory activity on the carrageenin-induced paw edema and platelet aggregation [US patent No. 5,804,603, Background of the Invention].

Heretofore, many reports have shown that *Zingiber officinale* exhibits various physiological activities. Typical examples include a cancer metastasis suppressing agent disclosed in Japan patent publication No. 7-10 258104; a synthesis promoter for neurotropic factor, which is effective for nerve deteriorative diseases such as Alzheimer's dementia or Parkinson's disease, disclosed in Japan patent publication No. 7-25777; an anti-rheumatic agent disclosed in Japan patent publication No. 6-293653, US patent Nos. 5,494,668 and 5,683,698; an anti-microbial composition 15 disclosed in Japan patent publication No. 6-227931; and an analgesic composition disclosed in Japan patent publication No. 6-107556. Ginger contains 1-4% essential oil (oleoresin). During the last 45 years many chemical investigations have been carried out on the constituents of the essential oil. Altogether more than 200 different volatiles have been 20 identified in essential oil wherein the pharmacological activity is confined. The essential oil contains a mixture of various terpenes as well as some other non-terpenoid compounds. Although this is mostly speculative, the experimental data and observations suggest that ginger inhibits both the cyclooxygenase and lipoxygenase products, i.e. it can be a dual inhibitor

of eicosanoid synthesis. In all 56 patients (28 with rheumatoid arthritis, 18 with osteoarthritis and 10 with muscular discomfort) used powdered ginger against their afflictions. Amongst the arthritis patients more than three-quarters experienced, to varying degrees, relief in pain and swelling.

5 All the patients with muscular discomfort experienced relief in pain. None of the patients reported adverse effects during the period of ginger consumption which ranged from 3 months to 2.5 years. (Srivastava and Mustafa; Medical Hypotheses; 1992; 39 342-348)

Non-steroidal anti-inflammatory drugs have three major actions, all of 10 which are related to inhibition of cyclo-oxygenase resulting in decreased formation of prostanoids. Firstly, an anti-inflammatory action achieved by reduced production of vasodilator prostaglandins ( $PGE_2$ ,  $PGI_2$ ) which means less vasodilation and, indirectly less edema. Secondly, an analgesic effect achieved by reduced prostaglandin production (less 15 sensitization of nociceptive nerve endings to the inflammatory mediators bradykinin and 5-hydroxytryptamine). Thirdly, an antipyretic effect which is probably due to a decrease in the mediator  $PGE_2$  generated in response to inflammatory pyrogens, such as interleukin-1. Since ginger inhibits prostanoid synthesis and also products of 5-lipoxygenase, its ameliorative 20 effects in arthritis and muscular discomforts could be related to reduced formation of prostanoids and leukotrienes. Because of such a possibility a decrease in the carageenan-induced edema formation in the rat's paw after 3 g of ginger extract administration has been demonstrated and the potency of the extract in the acute inflammation test appears to be

comparable to that exhibited by acetyl salicylic acid reported in the same study (Mascolo N. et al., Journal of Ethnopharmacology 1989, 27, 129-140).

5 *Dermatophytes*, especially *Trichophyton rubrum* and *Trichophyton mentagrophytes*, are the usual pathogens of onychomycosis and tinea pedis [Roberts DT., British Journal of Dermatology. 141 Supple 56:1-4, 1999 Nov.; Roldan YB. et al., Mycoses, 43(5):181-3, 2000]. *Pityrosporum ovale* (*Malassezia furfur*) is the etiological agent of pityriasis vesicolor, *Pityrosporum folliculitis* and *Malassezia intertrigo*. Several studies  
10 indicate a strong association of *Pityrosporum ovale* with seborrheic dermatitis and dandruff, a milder form of seborrheic dermatitis [Nenoff P. et al., Dermatology. 191(4):311-4, 1995; Bulmer AC. et al., Mycopathologia, 147(2)63-5, 1999].

15 Summary of the Invention

The present invention provides extracts from rhizomes of ginger which show in vitro an antifungal activity against *Trichophyton mentagrophytes* and *Pityrosporum ovale*. The extracts are prepared by extracting rhizomes of ginger with an organic solvent (such as ethyl ether, acetone, 20 methanol and ethanol) or supercritical CO<sub>2</sub>, or by steam distilling rhizomes of ginger to obtain a crude liquid, and subjecting said crude liquid to a reverse phase chromatography to obtain the extracts containing shogaols, gingerols and/or dehydrogingerdione.

## Detailed Description of the invention

As introduced in the Background of the Invention, ginger has been used for anti-inflammation and pain relief.

The present invention is to provide an effective method of preparing a product potent in antifungal activity from rhizomes of ginger. The potent product prepared in accordance with the method of the present invention has a substantially constant composition, so that the pharmacological effects thereof are definite.

The effective method of preparing product potent in antifungal activity from rhizomes of ginger according to the present invention comprises the following steps:

- a) preparing a crude liquid from rhizomes of ginger;
- b) introducing the crude liquid to a reverse phase chromatography column, and eluting the column with water, a first eluent and a second eluent in sequence, said second eluent having a polarity weaker than that of the first eluent but stronger than that of chloroform, so that a first eluate resulting from elution of the first eluent and a second eluate resulting from elution of the second eluent are obtained;
- c) removing the first eluent from the first eluate by evaporation, so that a first concentrated eluate is obtained and is able to be used as the potent product; and
- d) removing the second eluent from the second eluate by evaporation, so that a second concentrated eluate is obtained and is able to be used as the potent product;

wherein step a) comprises steps i) to iv), or comprises step I), step I'), or step I''), wherein said steps i) to iv) are:

i) shedding fresh rhizomes of ginger and filtering the resulting mixture to obtain a filtrate and a residue;

5       ii) extracting the filtrate with a first organic solvent, recovering the resulting extraction solution of the first organic solvent, and evaporating the first organic solvent from the extraction solution to obtain a first concentrated extraction solution;

10      iii) extracting the residue with a second organic solvent, recovering the resulting extraction solution of the second organic solvent, and evaporating the second organic solvent from the extraction solution to obtain a second concentrated extraction solution; and

15      iv) combining the first concentrated extraction solution and the second concentrated extraction solution to obtain the crude liquid;

15      said step I) is:

1) extracting powder of dried rhizomes of ginger with the second organic solvent, recovering the resulting extraction solution of the second organic solvent, and evaporating the second organic solvent from the extraction solution to obtain the crude liquid;

20      said step I') is:

I') steam distilling powder of dried rhizomes of ginger, and concentrating the resulting distillate by evaporation to obtain the crude liquid; and

      said step I'') is:

I") extracting powder of dried rhizomes of ginger with supercritical CO<sub>2</sub>, recovering the resulting extraction solution of the supercritical CO<sub>2</sub>, and evaporating CO<sub>2</sub> from the extraction solution to obtain the crude liquid.

The product potent in antifungal activity prepared according to the 5 method of the present invention preferably comprises 0 - 10 mg 6-shogaol per gram of the product, 1 - 150 mg 6-gingerol per gram of the product, and 0 - 40 mg 6-dehydrogingerdione per gram of the product.

The present invention also provides a pharmaceutical composition potent in antifungal activity comprising a therapeutically effective amount of 10 said crude liquid prepared in step a) of the method of the present invention, as an active ingredient, in admixture with a pharmaceutically acceptable carrier or diluent for the active ingredient.

The present invention also provides a pharmaceutical composition potent in antifungal activity comprising a therapeutically effective amount of 15 said product prepared according to the method of the present invention, as an active ingredient, in admixture with a pharmaceutically acceptable carrier or diluent for the active ingredient. Preferably, said product prepared according to the method of the present invention is the first concentrated eluate prepared in step c). Alternatively, said product 20 prepared according to the method of the present invention is the second concentrated eluate prepared in step d).

Preferably, said first eluent is methanol, and said second eluent is acetone.

Preferably, step a) of the method of the present invention comprises

steps i) to iv).

Preferably, said first organic solvent is ethyl ether.

Preferably, said second organic solvent is acetone, methanol, ethanol or a combination thereof. More preferably, said second organic solvent is  
5 acetone.

Preferably, step a) of the method of the present invention comprises step I).

Preferably, step a) of the method of the present invention comprises step I').

10 Preferably, step a) of the method of the present invention comprises step I").

A suitable reverse phase chromatography column for use in the method of the present invention includes (but not limited thereto) a reverse phase chromatography column packed with a porous resin, for examples

15 Diaion HP-20 (Mitsubishi Co.), Sephadex LH-20 (Pharmacia Co.) and RP-18 (Nacalai tesque Co.).

The pharmaceutical composition potent in antifungal activity of the present invention is preferably applied topically, for examples as a shampoo, a bath gel, soap, a body lotion, a body cream and a detergent.

20 Preferably, the pharmaceutical composition potent in antifungal activity of the present invention is used in the treatment of diseases associated with *Trichophyton mentagrophytes* or *Pityrosporum ovale*, including but are not limited to tinea pedis, tinea capitis, tinea cruris, tinea glabrosa, onychomycosis, pityriasis capitis, pityriasis vesicolor, pityrosporum

folliculitis, seborrheic dermatitis and dandruff. In particular, the antifungal pharmaceutical composition of the present invention is in the form of a shampoo for use in the treatment of dandruff.

Without further elaboration, it is believed that the above description 5 has adequately enabled the present invention. The following specific examples are, therefore, to be construed as merely illustrative, and not limitations on the remainder of the disclosure in any way whatsoever.

#### Determination of active ingredients

10 In the following examples, high performance liquid chromatography (abbreviated as HPLC) was used to determine the active ingredients of the products prepared therein. HPLC spectra were recorded on a HPLC instrument (HPLC Shimadzu LC-10AT, Japan) using a Cosmosil 5C-18 column (250 mm x 4.6 mm, packed with particles having 5  $\mu\text{m}$  diameter) by 15 an elution method. An HPLC sample was prepared by diluting an appropriate amount of a product with a mobile phase solution (hydrogen cyanide : water = 65 : 35, V/V) to 25 ml, and filtered with a 0.25  $\mu\text{m}$  membrane. The filtrate was introduced into the HPLC column, and eluted with the mobile phase solution. An UV detector (Shimadzu SPD-6AV, 20 Japan) was used to detect the absorption of the eluate at 230 nm.

#### Example 1:

2100 g of fresh rhizomes of ginger were shredded and filtered to obtain a filtrate and a residue. 500 ml of the filtrate was extracted with

500 ml ethyl ether three times, the organic phase layers were separated from the aqueous phase layers, and combined. Ethyl ether was evaporated from the combined extraction solution in vacuo to obtain a concentrated ethyl ether extraction product (I-OE). The ginger residue

5 was extract with 3000 ml acetone three times, the extraction solutions were recovered by filtration, and combined. Acetone was evaporated from the combined extraction solution in vacuo to obtain a concentrated acetone extraction product (I-O) (14.5 g). To a reverse phase chromatography column 300 mm x 30 mm packed with 180 g Diaion HP-20 resin having a

10 diameter of 500  $\mu$ m-800  $\mu$ m, 7 g of a mixture of the concentrate ethyl ether extraction product (I-OE) and the concentrated acetone extraction product (I-O) was injected. 1500 ml water, 2500 ml methanol, 2000 ml acetone and 2000 ml chloroform were used to carry out elution. The water eluate, methanol eluate, acetone eluate and chloroform eluate were collected

15 separately, and concentrated in vacuo to obtain 0.27 g concentrated water eluate (I-OW), 1.45 g concentrated methanol eluate (I-OM), 2.68 g concentrated acetone eluate (I-OA), and 0.83 g concentrated chloroform eluate (I-OC). The amounts (mg) of 6-shogaol, 6-gingerol and 6-dehydrogingerdione per gram of the I-O, I-OM and I-OA determined by

20 HPLC are listed in Table 1.

Table 1

Content (mg/g)	I-O	I-OM	I-OA
6-shogaol	1.10±0.14	1.15±0.0	—
6-gingerol	59.98±0.99	103.37±8.57	2.51±0.89
<u>6-dehydrogingerdione</u>	<u>7.68±0.42</u>	<u>8.94±0.41</u>	—

## Example 2:

500 g of shade dried rhizomes of ginger were pulverized and the  
 5 resulting powder was extracted with 30 L acetone trice (each time with 10  
 L). The three extraction solutions were combined together after filtration,  
 and then concentrated in vacuo to obtain 24 g of concentrated acetone  
 extraction product (II-O). To a reverse phase chromatography column  
 packed with 600 g Diaion HP-20 resin 20 g of the concentrated acetone  
 10 extraction product (II-O) was injected, which was then eluted with 4 L water,  
 6.5 L methanol, 15 L acetone and 5 L chloroform in sequence. The water  
 eluate, methanol eluate, acetone eluate and chloroform eluate were  
 collected separately, and concentrated in vacuo to obtain 2.5 g  
 concentrated water eluate (II-OW), 7.1 g concentrated methanol eluate (II-  
 15 OM), 6.9 g concentrated acetone eluate (II-OA), and 3.5 g concentrated  
 chloroform eluate (II-OC). The amounts (mg) of 6-shogaol, 6-gingerol and  
 6-dehydrogingerdione per gram of the II-O, II-OM and II-OA determined by  
 HPLC are listed in Table 2.

Table 2

Content (mg/g)	II-O	II-OM	II-OA
6-shogaol	1.98±0.00	4.96±0.00	—
6-gingerol	43.06±0.84	70.87±1.85	2.54±0.00
<u>6-dehydrogingerdione</u>	<u>9.33±0.85</u>	<u>19.15±4.57</u>	<u>2.35±0.28</u>

## Example 3:

10 Kg of shade dried rhizomes of ginger were pulverized and the  
 5 resulting powder was steam distilled for five hours. The distillate was  
 concentrated in vacuo to obtain 410 g of concentrated distillate (III-O). To  
 a reverse phase chromatography column packed with 600 g Diaion HP-20  
 resin 20 g of the concentrated distillate (III-O) was injected, which was then  
 eluted with 4.5 L water, 4.5 L methanol, 3 L acetone and 5 L chloroform in  
 10 sequence. The water eluate, methanol eluate, acetone eluate and  
 chloroform eluate were collected separately, and concentrated in vacuo to  
 obtain 0.03 g concentrated water eluate (III-OW), 14.5 g concentrated  
 methanol eluate (III-OM), 0.85 g concentrated acetone eluate (III-OA), and  
 0.2 g concentrated chloroform eluate (III-OC). The concentrated distillate  
 15 (III-O) contains no 6-shogaol, 6-gingerol and 6-dehydrogingerdione  
 determined by HPLC.

## Example 4:

10 g of powder of shade dried rhizomes of ginger was extracted with

1000 ml acetone at 50°C for two hours. The extraction solution was separated and concentrated in vacuo (40°C, 75 mmHg) to obtain a concentrated acetone extraction product (IV-O). The color and viscosity of the product (IV-O) together with its yield are listed in Table 3.

5

Example 5:

10 g of powder of shade dried rhizomes of ginger was steam distilled, and the oily distillate after being separated from the aqueous distillate was freeze dried to obtain an oily extract (V-O). The color and viscosity of the 10 oily extract (V-O) together with its yield are listed in Table 3

Example 6:

To 10 g of powder of shade dried rhizomes of ginger in a 250 ml extraction chamber CO<sub>2</sub> was introduced at a flow rate of 45 L/min, wherein 15 the chamber pressure was controlled at 2500 to 4000 psia with a high pressure pump (Model No. EK-1, LEWA Co., US) and the chamber temperature was maintained at 35-60°C with a heat exchanger (Model No. H-2410, HOTECH Co., US) and an exterior circulation system. The extraction was stopped when the volume of CO<sub>2</sub> introduced reached 300 L, 20 and a supercritical CO<sub>2</sub> extraction product (VI-O) was obtained after evaporation of CO<sub>2</sub>. The color and viscosity of the product (VI-O) together with its yield are listed in Table 3. The contents of pungent components determined by HPLC are listed in Table 4.

Table 3

	IV-O	V-O	VI-O
L*	87.6	80.4	96.3
A*	-9.1	-0.1	-9.6
B*	31.1	9.6	22.0
Viscosity (cPs)	15.6	11.8	12.1
Yield (%)	3.8	2.2	3.9

\*: the values of L, A, and B were determined by using a Σ90 color measuring system, (Nippon Denshoku Inc, Co., Ltd., Japan), wherein L represents lightness, A is the red/green difference and B is the yellow/blue difference.

Table 4

Content (mg/g)	VI-O
6-shogaol	17.30±0.00
6-gingerol	26.29±0.00
6-dehydrogingerdione	19.20±1.19

Example 7: Evaluation of inhibitory activity on *Trichophyton*

10 *mentagrophytes* or *Pityrosporum ovale*

Anti-*Trichophyton mentagrophytes* assay

Minimum inhibitory concentration (MIC) of ginger extract was determined and conducted according to the method previously described by Edwards, J. R. et al. (Edwards, J. R. et al., Antimicrobial Agents

Chemotherapy 33: 215-222, 1989). The test substance was dissolved and serially diluted in solvent (100% DMSO) to desired stock concentrations. For each concentration tested, a 0.01 ml aliquot was added to a 48-well plate containing 0.99 ml of Potato Dextrose Broth

5 (DIFCO, U.S.A.) with  $10^3$ - $10^4$  CFU/ml of *Trichophyton mentagrophytes* (ATCC 9533). The plates were incubated at 28°C for 72 hours and then visually examined and scored. Vehicle-control was used as blank control.

Each concentration was evaluated in duplicate. The results are shown in Table 5.

10 Anti-*Pityrosporum ovale* assay

Minimum inhibitory concentration (MIC) of ginger extract was determined and conducted by the method as mentioned above (Edwards, J. R. et al., Antimicrobial Agents Chemotherapy 33: 215-222, 1989). The test substance was dissolved and serially diluted in solvent (100% DMSO)

15 to desired stock concentrations. For each concentration tested, a 0.01 ml aliquot was added to a 48-well plate containing 0.99 ml of Fluid Sabouraud Medium (DIFCO, U. S. A.) with  $10^3$ - $10^4$  CFU/ml of *Pityrosporum ovale* (ATCC 38593). The plates were incubated at 37°C for 48 hours and then visually examined and scored. Vehicle-control was used as blank control.

20 Each concentration was evaluated in duplicate. The results are shown in Table 5.

Table 5. The inhibitory effects of ginger extracts on *Pityrosporum ovale* (Po) and *Trichophyton mentagrophytes* (Tm)

Ginger extract <sup>a)</sup>	MIC (µg/ml)	
	Po	Tm
I-O	100	30
I-OM	100	30
